

# How The Software Calculates The Score

One of the reasons **TUNEin™ to READING** is so successful is the score. How exactly does it work? In general terms, the score measures the amount of time your voice is on pitch and in rhythm. More specifically, the computer calculates exactly how frequently your voice, represented by the white pitch-tracking line on the computer screen, is “on target” or “on pitch” within the blue pitch bands. Our ability to display the pitch-tracking line is based on advanced algorithms that detect the fundamental frequency of your voice, filtering out all background noise and harmonics. See an example of pitch lines within and beyond the blue “on pitch” bands below:
